Document produced by Roman Michele for evaluation purpose

The problem

Manual creation of trading strategies can be slow and prone to **errors**, leading to **issues** with both time efficiency and reliability.

The solution

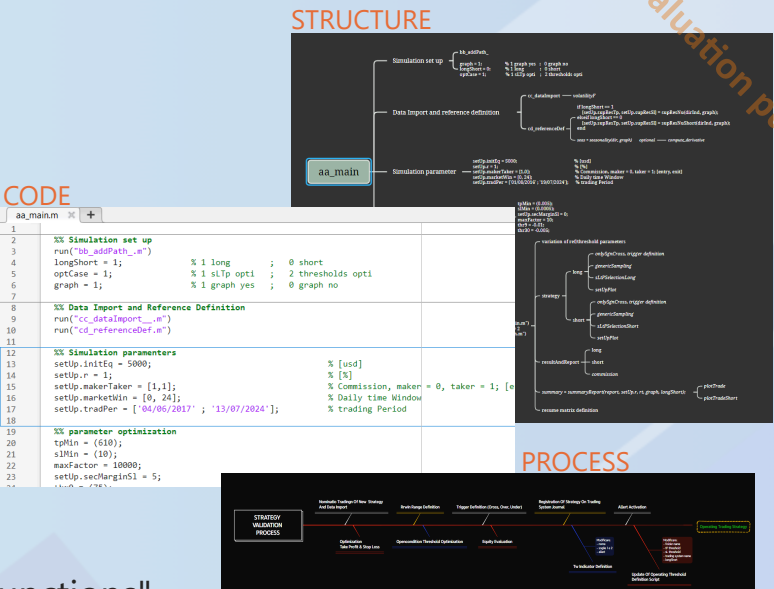

A software that **speeds up** the process of **creating and evaluating trading strategies**, reducing errors and increasing efficiency.

Main characteristics of this project

- 1. Simple Moving Average strategy evaluation through **backtesting on hystorical data**
- 2. **Optimization** of strategy parameters
- 3. Generation of **detailed reports** and **summary**

Tools

- 1. The software is developed in Matlab* and it is structured through general "code block" and "functions".
- 2. The raw data are download from Trading view*.
- 3. Reports can be displayed in Matlab and in Microsoft Power BI

*The purpose of this presentation is to showcase software development capabilities. No software or data is intended to be sold.

Definition of Take Profit and Stop Loss

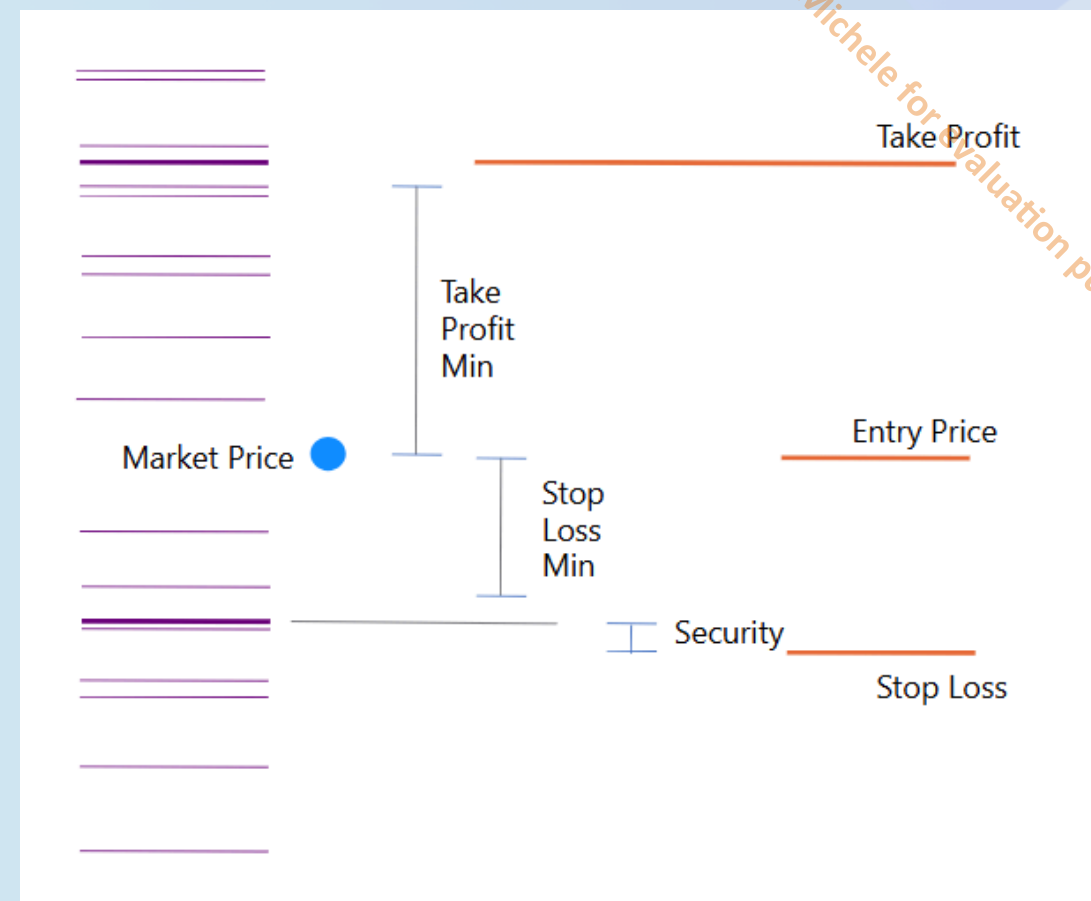

When a trade is opened at a certain 'Market Price,' it is necessary to set Take Profit and Stop Loss levels. When one of these levels is reached, the trade is closed: a profit is made if the Take Profit is hit, and a loss occurs if the Stop Loss is reached.

In this strategy, the levels are determined by considering the next relevant level after a 'Min' threshold ('Take Profit Min' and 'Stop Loss Min'). These levels correspond to all significant price reversals in the closing price on a 1D time frame.

Price reversal areas with their occurance

Selection of take profit and stop loss

SMA9 & SMA30

Oscillator SMA9 & Threshold 9

Oscillator SMA30 & Threshold 30

Trading condition (referring 1h timeFrame):

- 1 - $\text{sma9} > \text{sma30}$
- 2 - $d(\text{sma9}) > \text{thr9}$
- 3 - $d(\text{sma30}) > \text{thr30}$

Document produced by Roman Michele for evaluation purpose

Trading strategy report and summary

Once the Take Profit and Stop Loss levels, along with the oscillator thresholds, are optimized, it is possible to run an extensive simulation over the selected period. This generates a detailed report of all the trading operations performed, including all relevant details.

On the next page, you will find the summary values and visuals obtained from the simulation.
